**Аннотация.** Исследование направлено на определение изменений поверхностных свойств, вызванных использованием отбеливающих химикатов на древесине менгкуланг (*Heritiera javanica* (Blume) Kosterm.). С этой целью была создана контрольная группа, на поверхности древесины которой были нанесены химикаты оксаловая кислота ( $C_2H_2O_4$ ) и перекись водорода ( $H_2O_2$ ) + гидроксид натрия (NaOH), после чего были произведены измерения цвета, блеска и индекса белизны ( $WI^*$ ). Согласно полученным результатам, значения измерений блеска, проведенных на волокнах  $\parallel$  и  $\perp$   $20^\circ$ , оказались незначительными, в то время как все остальные тесты были признаны значимыми. Значения  $\Delta E^*$  составили 3,73 для отбеливания  $C_2H_2O_4$  и 13,81 для отбеливания  $H_2O_2 + NaOH$ . С обоими отбеливающими веществами были отмечены увеличения значений  $WI^*$ ,  $b^*$ ,  $L^*$ ,  $C^*$  и  $h^\circ$  в обоих направлениях, в то время как уменьшения были определены в значениях блеска при  $60$  и  $85^\circ$ .

**Ключевые слова:** отбеливание, глянец, мангкуланг, цвет, херитиера яванская, индекс белизны

**Abstract.** This study aimed to determine the changes in certain surface properties caused by the use of wood bleaching chemicals on Mengkulang (*Heritiera javanica* (Blume) Kosterm.) timber. For this purpose, a control group was established, and oxalic acid (C<sub>2</sub>H<sub>2</sub>O<sub>4</sub>) and hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) + sodium hydroxide (NaOH) chemicals were applied to the wood material surfaces, followed by measurements of color, glossiness, and whiteness index (*WI\**) properties. According to the obtained results, values for glossiness test measurements conducted on fibers  $\parallel$  and  $\perp$  20° were found to be insignificant, while all other tests were determined to be significant. The  $\Delta E^*$  values were calculated as 3,73 for C<sub>2</sub>H<sub>2</sub>O<sub>4</sub> bleaching and 13,81 for H<sub>2</sub>O<sub>2</sub> + NaOH bleaching. With both bleaching agents, increases were observed in *WI\**, *b\**, *L\**, *C\**, and *h<sub>o</sub>* values in both directions, while decreases were determined in glossiness values at 60 and 85 degrees.

**Keywords:** Bleaching, glossiness, mengkulang, color, *Heritiera javanica*, whiteness index

### Introduction

Mature wood is a natural amalgamation of elongated cells lacking biological function, commonly recognized as wood fibers, forming an organic composite material. The cellular structures of these fibers are primarily composed of cellulose fibrils (40–50 %), characterized by a predominantly crystalline arrangement, ensconced within an amorphous framework comprising hemicellulose (20–35 %) and lignin (20–30 %). Additionally, wood encompasses varied proportions of non-structural organic compounds of low molecular weight, termed extractives, along with mineral constituents (ash). Lignin is notably concentrated in the outermost layer of the cell wall (middle lamella), playing a pivotal role in bonding the fibers together within the wood (Sjöström, 1981; Wood..., 1984; Pinto et al., 2005).

Color fading occurs both indoors and outdoors. Many factors and elements contribute to the fading of wood color (Hon and Minemura, 2000). Bleaching is

also used to alter the properties of wood surfaces before finishing and to reduce yellowing caused by light (Chemical treatment..., 1995; Finishing properties of poly..., 2021).

When using alkaline bleaches, especially when caustic is part of the process, it is usually necessary to neutralize the wood's surface before further finishing with varnish or lacquers (Zeilman, 1960).

As a result of chemical treatments, the quantity of covalent bonds within cellulose, hemicellulose, and lignin diminishes. This reduction in covalent bonds correlates with a lightening of the wood's color. Various bleaching agents, notably hydrogen peroxide, and occasionally oxalic acid, sodium hypochlorite, and sodium bisulfite, are commonly employed for this purpose (Forest Products Laboratory..., 1967; Csiha and Papp, 2013).

The Mengkulang – palapi (*Heritiera javanica*) tree species belongs to the genus *Heritiera* in the Malvaceae family (Laraño and Buot, 2010). The distribution of Mengkulang in natural forests is scattered.

If harvesting is not done with good management, the presence of this species will rapidly decline, preventing its commercialization as a valuable timber species. The flowering and fruiting of this species in nature are low, leading to low natural regeneration (PROSEA, 1994). This tree species has been reported to be used as particleboard (Sahromi et al., 2015).

In *Heritiera javanica* wood, the moisture content is 51,00 %, density is 0,52 g/cm<sup>3</sup>, air-dried density is 0,640 g/cm<sup>3</sup>, bending strength is 68,00–92,00 MPa, modulus of elasticity is 10600–12200 MPa, maximum compression strength is 31,80–50,30 MPa, hardness is 4230,00–4674,00 N, parallel shear strength (radial) is 9,90 MPa, parallel shear strength (tangential) is 11,70 MPa, splitting resistance (radial) is 57,00 N/cm, and splitting resistance (tangential) is 63,00 N/cm (Shan, 1988).

In this study, the changes caused by wood bleaching chemicals in mengkulang (*Heritiera javanica* (Blume) Kosterm.) wood were determined.

## Materials and Methods

### Wood Material

Mengkulang (*Heritiera javanica* (Blume) Kosterm.) wood was selected as the focus of this investigation. Test specimens were fashioned to dimensions of 100 mm × 100 mm × 15 mm. Following this, the samples underwent environmental conditioning at 20 ± 2 °C and 65 % relative humidity (ISO 554, 1976).

### Bleaching Chemicals

Oxalic acid (C<sub>2</sub>H<sub>2</sub>O<sub>4</sub>) and hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) + sodium hydroxide (NaOH) were utilized as bleaching agents in this study.

### Application of Bleaching

These chemicals were applied to the wooden material surfaces using a single-coat application technique.

### Determination of Glossiness Characteristics

Glossiness measurements were performed utilizing the ETB-0833 model gloss meter device in accordance with the ISO 2813 (1994) standard at three distinct angles (20°, 60° and 85°) in both perpendicular and parallel orientations to the fibers.

### Determination of Whiteness Index (WI\*)

#### Characteristics

In this research, the Whiteness Meter BDY-1 instrument was employed to measure the whiteness index (WI\*) values, following the ASTM E313-15e1 standard of 2015.

### Determination of Shore D Hardness Value

The Shore D hardness value was determined in accordance with ASTM D 2240 (2010). The measurements were taken using a Stand: model Ld-J Loyka and a Durometer from Shenzhen Yibai Network Technology Co., Ltd., Guangdong, China, with a 5 kg load applied. A total of 10 measurements were conducted.

### Color Measurements Determination of Color Characteristics

The color change of the samples was measured using the CS-10 (CHN Spec, China) device according to ASTM D 2244-3 (2007) standard, [CIE 10° standard observer; CIE D65 light source, illumination system: 8/d (8°/diffuse illumination)]. The examination was carried out utilizing the CIELAB color model. The comprehensive alterations in color were assessed utilizing the provided equations.

$$\Delta a^* = (a^*_{bleached\ applied}) - (a^*_{control}), \quad (1)$$

$$\Delta L^* = (L^*_{bleached\ applied}) - (L^*_{control}), \quad (2)$$

$$\Delta b^* = (b^*_{bleached\ applied}) - (b^*_{control}), \quad (3)$$

$$\Delta E^* = \left( (\Delta L^*)^2 + (\Delta b^*)^2 + (\Delta a^*)^2 \right)^{1/2}, \quad (4)$$

$$C^* = \left( (a^*)^2 + (b^*)^2 \right)^{1/2}, \quad (5)$$

$$\Delta C^* = (C^*_{bleached\ applied}) - (C^*_{control}), \quad (6)$$

$$h^o = \arctan (b^*/a^*), \quad (7)$$

$$\Delta H^* = \left( (\Delta E^*)^2 - (\Delta L^*)^2 - (\Delta C^*)^2 \right)^{1/2}. \quad (8)$$

The definitions of  $\Delta a^*$ ,  $\Delta C^*$ ,  $\Delta b^*$ , and  $\Delta L^*$  are presented in Table 1 according to Lange (1999).

The comparison criteria for the visual evaluation of the calculated  $\Delta E^*$  color difference are provided in Table 2 according to DIN 5033 (1979).

Table 1

The definitions of  $\Delta a^*$ ,  $\Delta C^*$ ,  $\Delta b^*$  and  $\Delta L^*$  (Lange, 1999)

Test	Positive Description	Negative Description
$\Delta b^*$	More yellow than the reference	More blue than the reference
$\Delta L^*$	Lighter than the reference	Darker than the reference
$\Delta a^*$	More red than the reference	More green than the reference
$\Delta C^*$	Clearer, brighter than the reference	More dull, matte than the reference

Table 2

Comparison criteria for  $\Delta E^*$  evaluation (DIN 5033, 1979)

Visual	Total Color Difference	Visual	Total Color Difference
Undetectable	<0,2	Very Distinct	3,0–6,0
Very Weak	0,2–0,5	Strong	6,0–12,0
Weak	0,5–1,5	Very Strong	> 12,0
Distinct	1,5–3,0		

### Statistical Analysis

In this research, SPSS software was utilized to examine various factors, encompassing minimum and maximum values, group identification based on similar characteristics, standard deviations, percentage variations (%), multivariate coefficients of variation, and averages.

### Results and Discussion

The measurement results for shore D hardness value are provided in Table 3. According to the determined result, the shore D hardness value is 61,10 HD and ranges between 51,00–60,00 HD (Table 3).

The results for total color differences are presented in Table 4.

According to these results, the  $\Delta E^*$  values were determined to be 3,73 with  $C_2H_2O_4$  bleaching and 13,81 with  $H_2O_2 + NaOH$  bleaching. The  $\Delta L^*$  (lighter compared to reference),  $\Delta b^*$  (redder compared to reference), and  $\Delta C^*$  (clearer, brighter compared to reference) values were calculated as positive results (Table 4).

When compared with the color change criteria (DIN 5033, 1979), it was determined that the results corresponded to “very distinct (3,0 to 6,0)” with  $C_2H_2O_4$  and “very strong (> 12,0)” with  $H_2O_2 + NaOH$ .

Table 3

Results for shore D hardness value

Mean (HD)	Standard deviation	Number of Measurements	Coefficient of Variation	Minimum	Maximum
61,10	2,38	10	3,89	59,00	66,00

Table 4

Results for total color differences

Chemical type	$\Delta L^*$	$\Delta a^*$	$\Delta b^*$	$\Delta C^*$	$\Delta H^*$	$\Delta E^*$	Color criterion (DIN 5033, 1979)
$C_2H_2O_4$	1,06	2,06	2,92	3,94	–	3,73	Very distinct (3,0 – 6,0)
$H_2O_2 + NaOH$	10,91	–1,04	8,41	6,23	5,74	13,81	Very strong (> 12,0)

The  $\Delta E^*$  value of  $H_2O_2 + NaOH$  chemical was found to be approximately 4 times larger than that of  $C_2H_2O_4$  chemical. Additionally, the  $\Delta a^*$  values were found to be positive (redder compared to reference) with  $C_2H_2O_4$  and negative (greener compared to reference) with  $H_2O_2 + NaOH$  (Table 4).

The results of the variance analysis are presented in Table 5. The gloss test measurements taken at  $20^\circ$  to the fibers ( $\parallel$ ) and perpendicular ( $\perp$ ) were found to be insignificant, while all other tests were found to be significant (Table 5).

The measurement results determined for the color parameters are shown in Table 6. In terms of color parameters, increases in  $b^*$ ,  $L^*$ ,  $C^*$ , and  $h^o$  values were observed with both bleaching agents (Table 6).

The highest measured  $L^*$  value was found with the  $H_2O_2 + NaOH$  bleaching agent (50,37), while the lowest was found in the unbleached control group samples (39,46).  $L^*$  values increased by 2,69 % with  $C_2H_2O_4$  bleaching and by 27,65 % with  $H_2O_2 + NaOH$  bleaching (Table 6).

For  $a^*$ , the lowest result was obtained with the  $H_2O_2 + NaOH$  bleaching agent (11,82), and the highest was found with the  $C_2H_2O_4$  chemical (14,92). The  $a^*$

parameter showed an increase of 16,02 % with  $C_2H_2O_4$  and a decrease of 8,09 % with the  $H_2O_2 + NaOH$  chemical (Table 6).

In the  $b^*$  value, the highest result was seen with the  $H_2O_2 + NaOH$  chemical (21,84), and the lowest was obtained in the unbleached control group samples (13,44). The  $b^*$  test showed increases with both bleaching chemicals ( $C_2H_2O_4$ : 21,65 % and  $H_2O_2 + NaOH$ : 62,50 %) (Table 6).

For the  $C^*$  parameter, the highest result was determined with the  $H_2O_2 + NaOH$  bleaching agent (24,84), and the lowest was seen in the control group samples (18,61). Increases in  $C^*$  values were also observed with both wood bleaches ( $C_2H_2O_4$ : 22,12 % and  $H_2O_2 + NaOH$ : 33,48 %) (Table 6).

The highest measured  $h^o$  value was determined with the  $H_2O_2 + NaOH$  bleaching agent (61,60), while the lowest was found in the control group samples (46,28). Increases in  $h^o$  values were recorded at 0,45 % with  $C_2H_2O_4$  and 33,10 % with  $H_2O_2 + NaOH$  (Table 6).

The results for the whiteness index ( $WI^*$ ) values are provided in Table 7.

COV: Coefficient of Variation, SD: Standard Deviation, \*: Highest Value, \*\*: Lowest Value.

Increases in *WI\** values in both directions were identified with both bleaching agents. These increases in *WI\** values were determined to be 5,06 % with  $C_2H_2O_4$  and 66,61 % with  $H_2O_2 + NaOH$  perpendicular to the fibers ( $\perp$ ), and 3,55 % with  $C_2H_2O_4$  and 170,21 % with  $H_2O_2 + NaOH$  parallel to the fibers ( $\parallel$ ). The lowest *WI\** values in both directions were found in the control group samples ( $\perp$ : 6,32 and  $\parallel$ : 2,82), while the highest were obtained in the  $H_2O_2 + NaOH$  treated samples ( $\perp$ : 10,53 and  $\parallel$ : 7,62) (Table 7).

Table 8 presents the results for the glossiness values. Decreases were observed in glossiness values at 60° and 85° in both directions (at 60° perpendicular to the fibers: 50,68 % with  $C_2H_2O_4$  and 63,70 % with  $H_2O_2 + NaOH$ ; parallel to the fibers: 26,09 %

with  $C_2H_2O_4$  and 53,26 % with  $H_2O_2 + NaOH$ ; at 85° perpendicular to the fibers: 87,14 % with  $C_2H_2O_4$  and 92,86 % with  $H_2O_2 + NaOH$ ; parallel to the fibers: 69,14 % with  $C_2H_2O_4$  and 94,86 % with  $H_2O_2 + NaOH$ ). At 60° and 85°, the highest glossiness results were obtained in the unbleached wood samples, while the lowest were found in the  $H_2O_2 + NaOH$  bleached samples. No changes were observed in gloss measurements at 20° in both directions after bleaching applications (Table 8).

Table 9 shows comparisons from various studies. The results indicate that different types of wood materials exhibit different behaviors in response to the chemicals used.

## Conclusions

– The gloss test measurements taken at 20° to the fibers (||) and perpendicular (⊥) were found to be insignificant, while all other tests were found to be significant.

– The  $\Delta E^*$  value was determined to be 3.73 with  $C_2H_2O_4$  and 13.81 with  $H_2O_2 + NaOH$ .

– With bleaching agents, increases were observed in  $WT^*$ ,  $L^*$ ,  $b^*$ ,  $C^*$ , and  $h^o$  values in both directions, while decreases were obtained in gloss values at 60° and 85° in both directions.

– It is recommended to perform aging (natural/artificial) test performances on the materials.
